RÉSHAM

A PARIS HOUSE SINCE 1987

ONE PLATFORM. THREE DOORS.

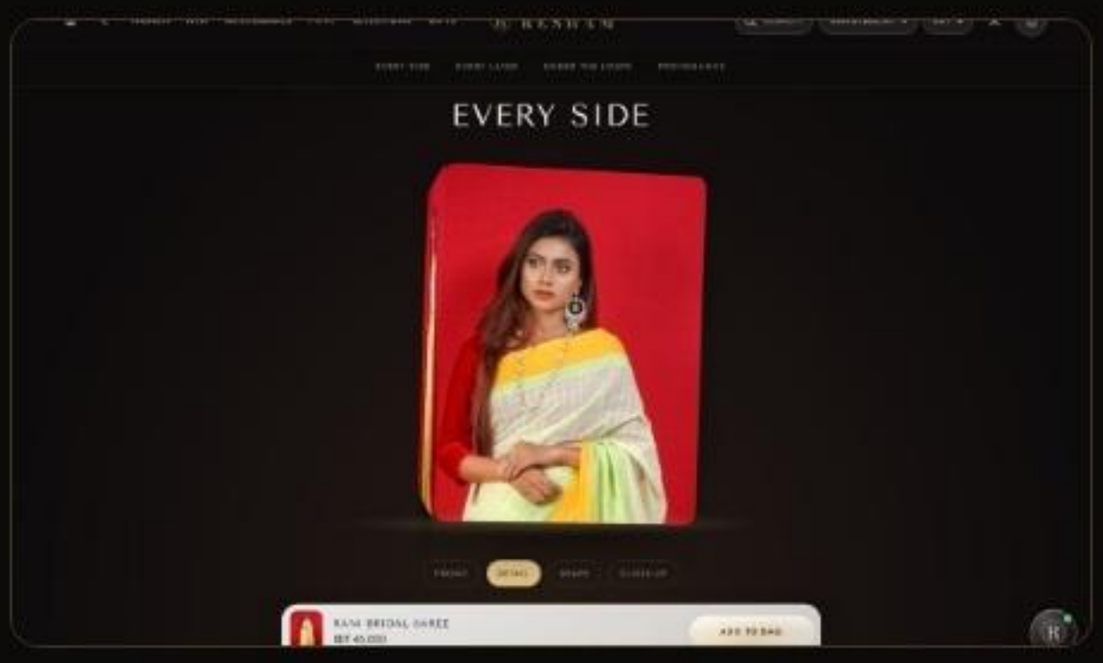

A full-stack e-commerce build for a fashion house: the shop customers see, the console the owner runs it from, and a portal for delivery riders.

THE SHOP

EVERY PIECE TELLS ITS STORY

Each product page walks through the piece: every side, what it is made of, the close-ups and where it comes from.

EVERY SIDE

The piece turns as you scroll.

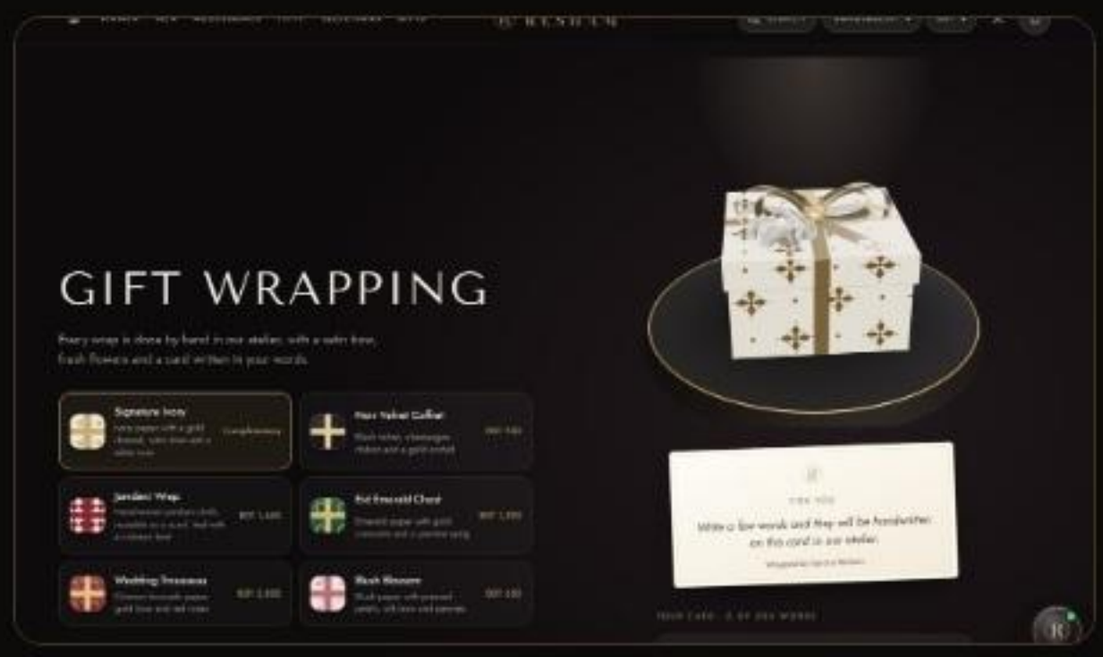

WHAT IT'S MADE OF

Each material, and where it comes from.

UNDER THE LOUPE

Close-ups of the weave, with its facts.

GIFTS IN 3D

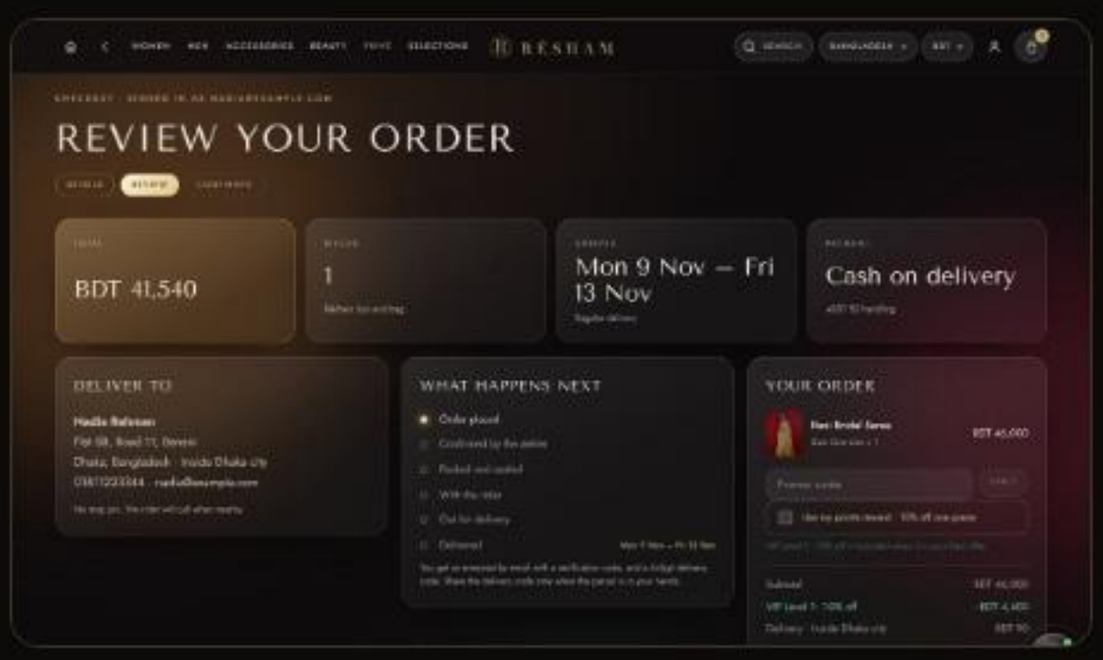

Six wraps drawn in Three.js, and a card.

Bangladesh and France · 18 currencies · Live stock per size · Search with /

ORDERING AND AFTER

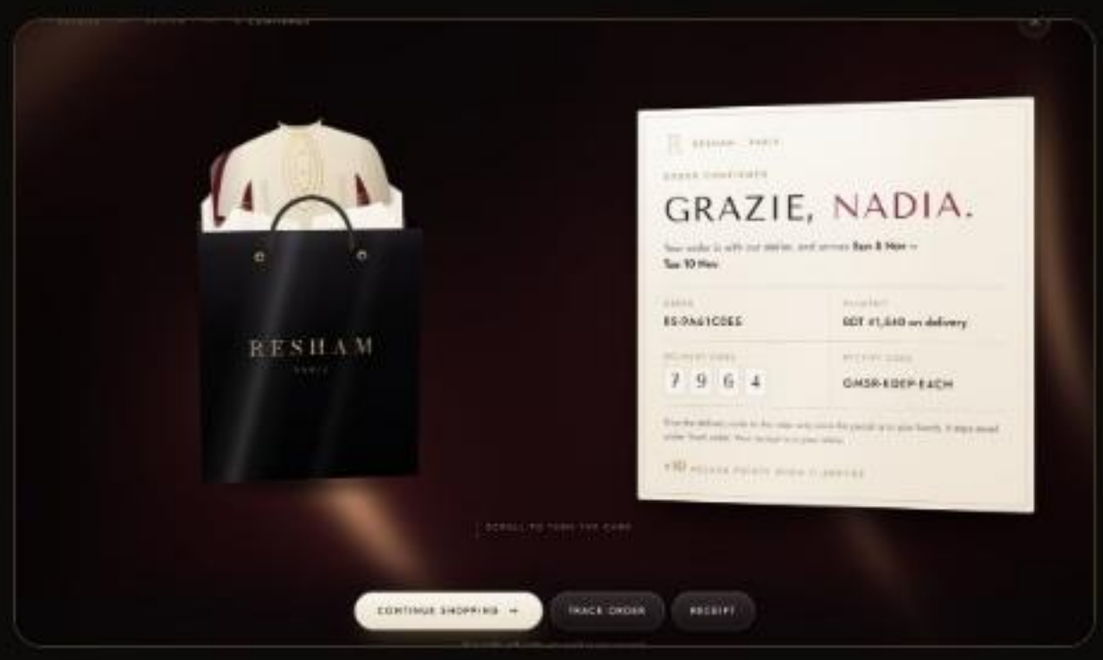

FROM THE BAG TO THE DOOR

Order for yourself or as a gift. The receiver gets the delivery messages and the code, the sender gets the receipt.

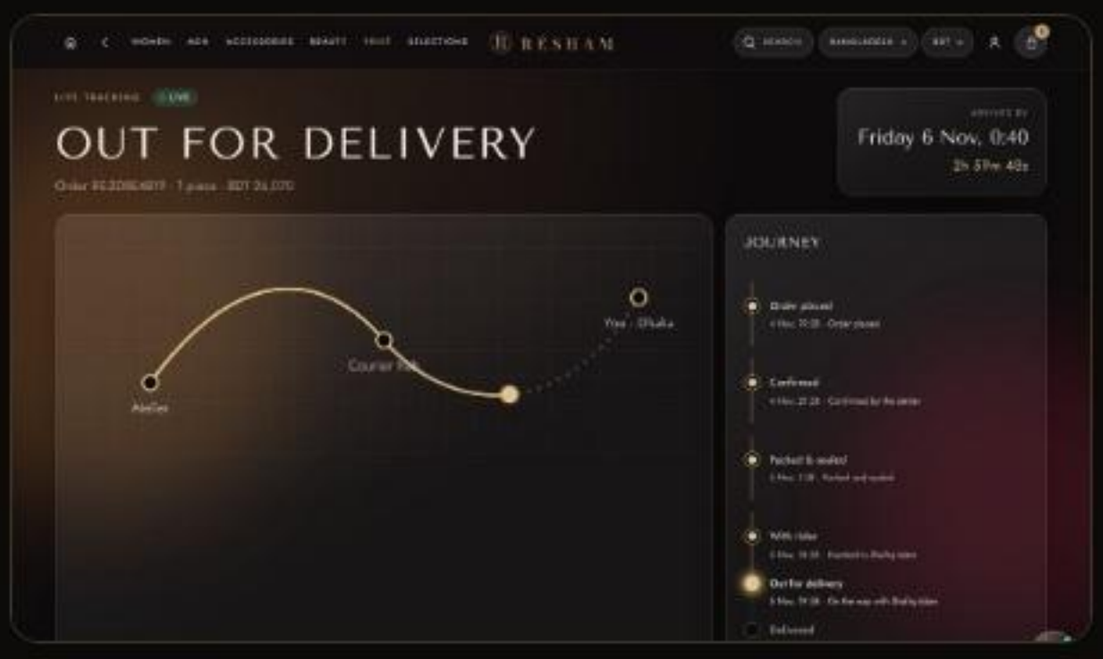

01 CHECKOUT

Three delivery speeds with dates. Cash on delivery or online.

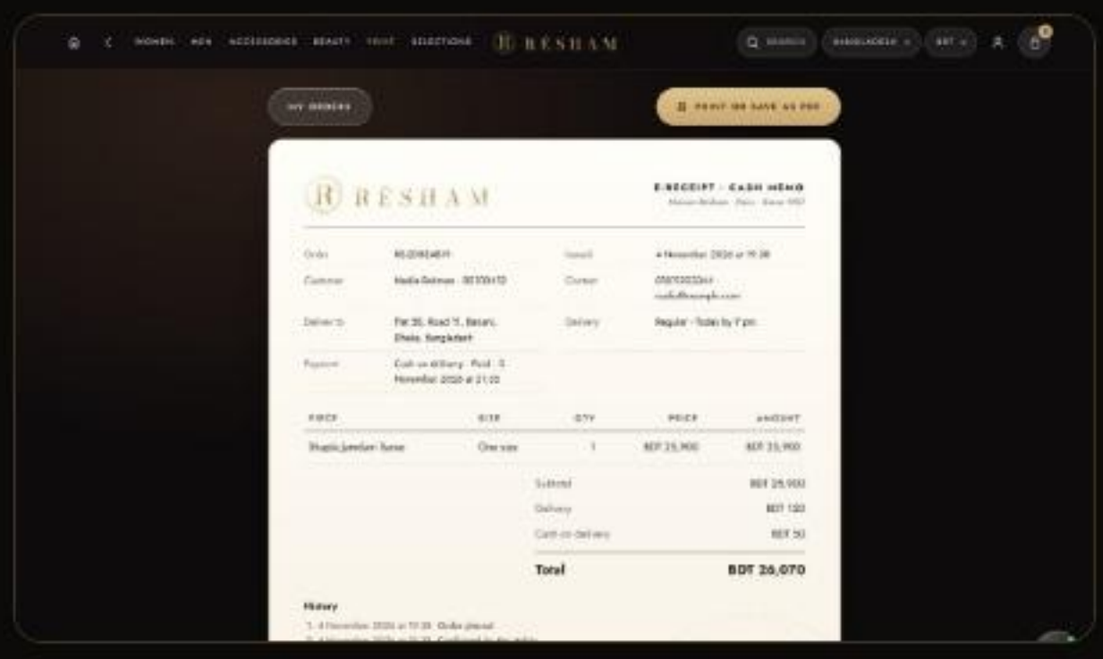

02 CONFIRMED

A 4-digit code, given only to the rider at the door.

03 LIVE TRACKING

The rider's name and location, as it happens.

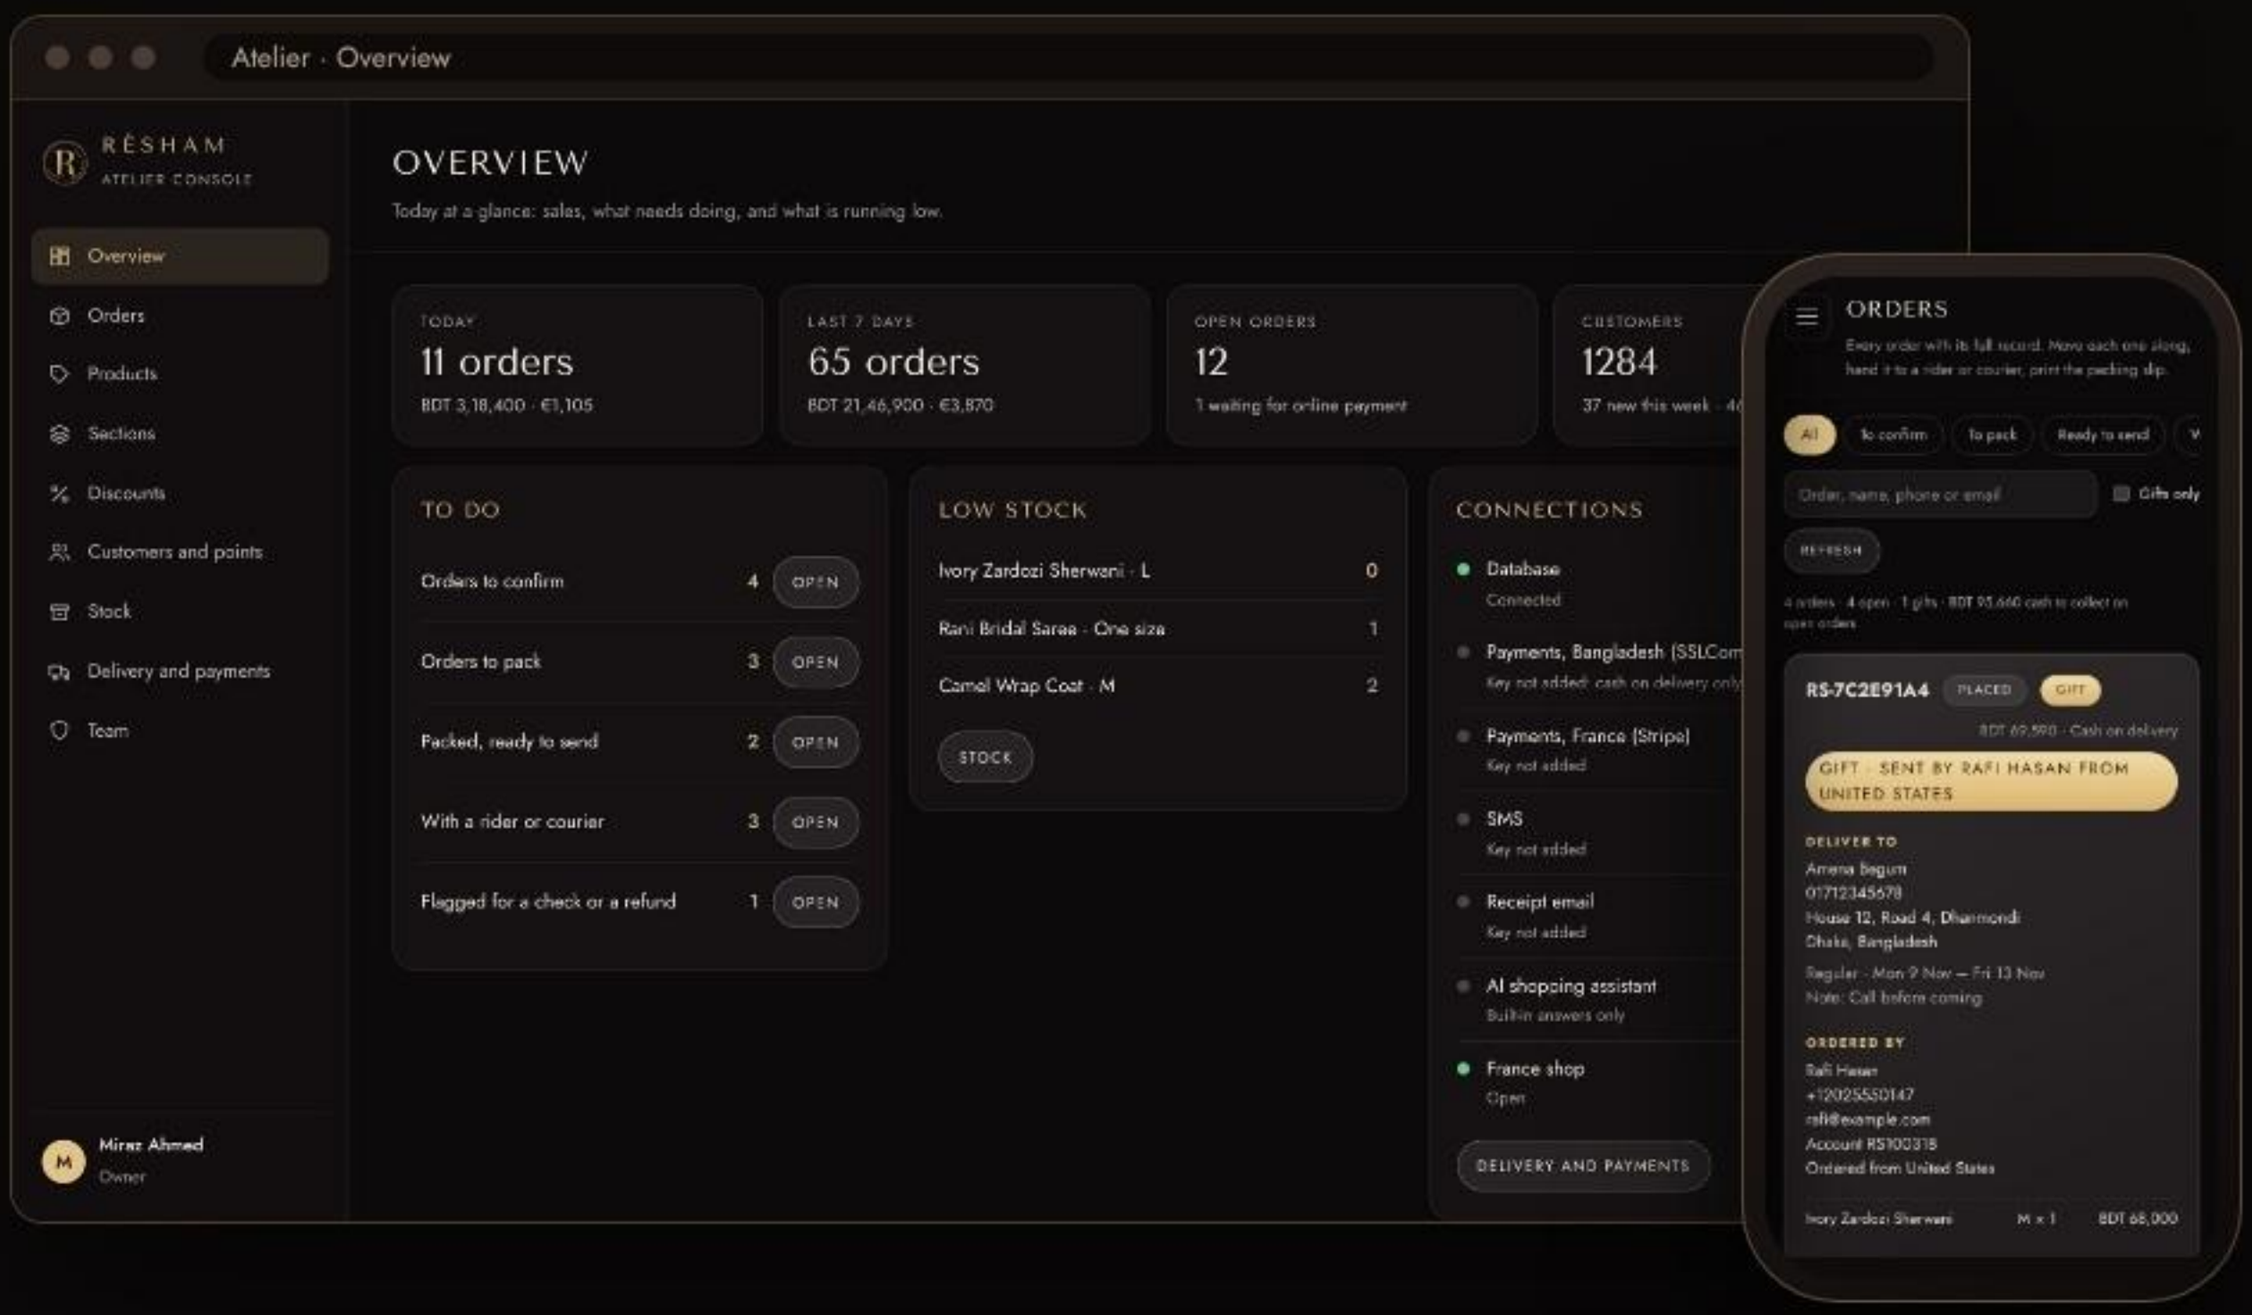

04 E-RECEIPT

A QR and a 12-character code anyone can check.

THE ATELIER CONSOLE

RUN THE WHOLE HOUSE

The owner and staff run every order, piece, discount and delivery from one console. Changing any of it needs no code and no deploy.

- Confirm, pack, hand to a rider or courier
- Sale prices, piece codes, order codes
- Delivery fees and the France shop
- Risky payments held for a person
- Points, VIP cards and in-store sales
- Owner and staff roles, checked on the server

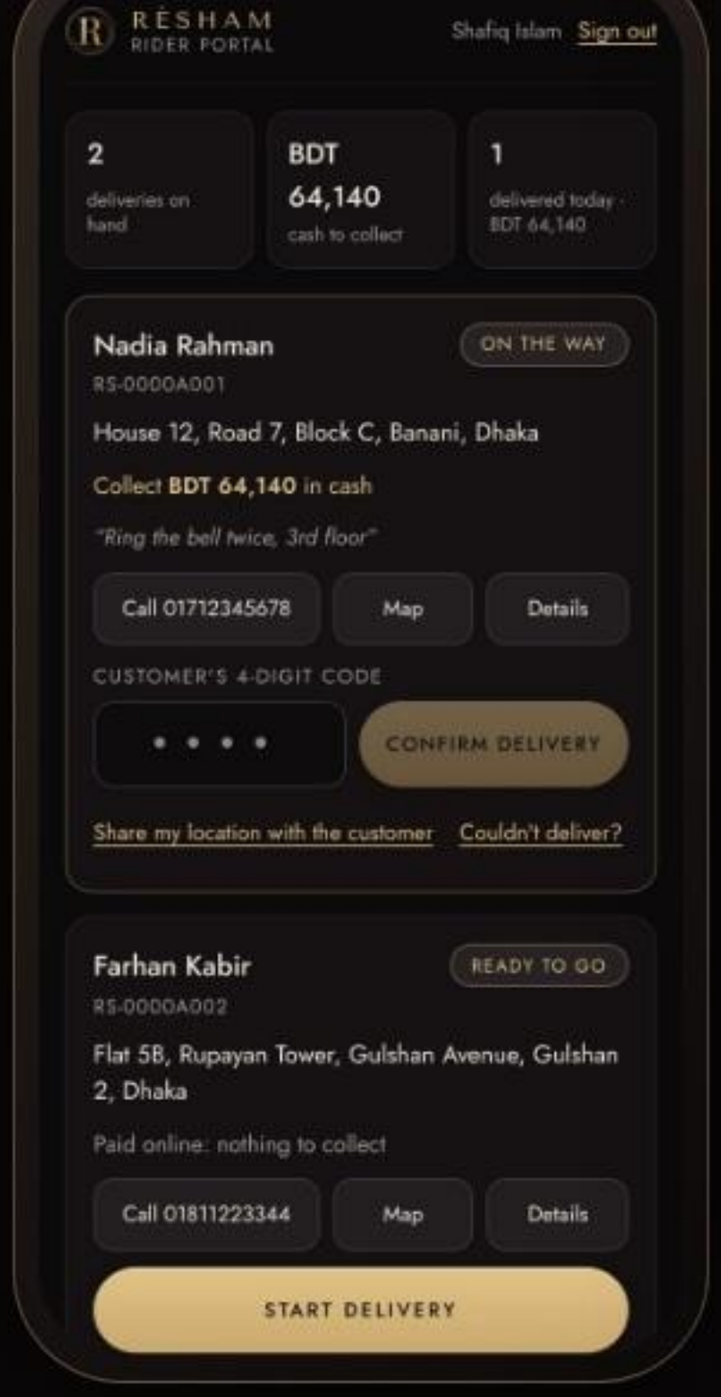

THE RIDER PORTAL

ITS OWN SIGN-IN

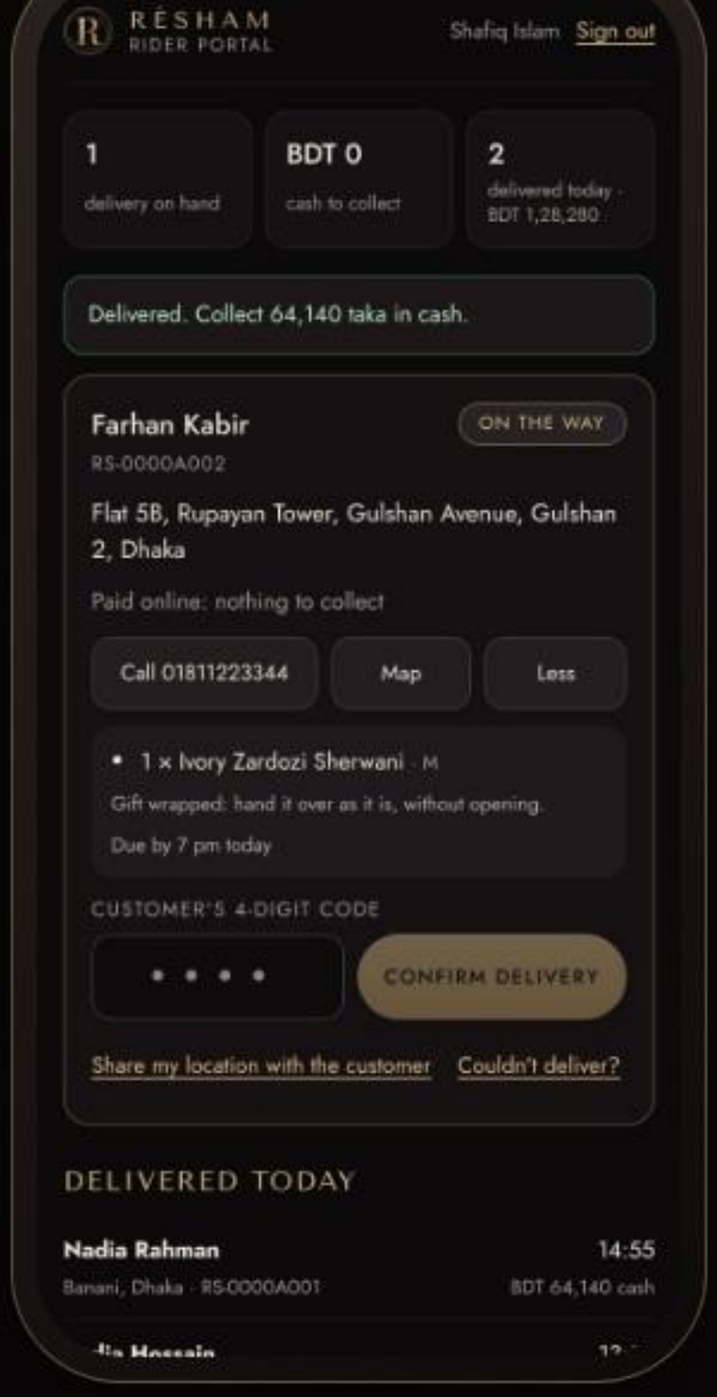

Riders see only their own deliveries, with what the door needs, and confirm each one with the customer's 4-digit code.

SIGN IN AT /RIDER

ONLY THEIR DELIVERIES

CONFIRMED BY CODE

A rider login can't shop or open the console, and the owner's sign-in never opens the portal. A wrong code never marks an order delivered.

SECURE BY DESIGN

23
API ROUTES

13
TABLES, ROW-LEVEL SECURITY ON ALL

380
AUTOMATED CHECKS

2
SEPARATE SIGN-INS

- The browser never talks to the database directly.
- The server recomputes every price and reserves stock atomically.
- A payment counts only when SSLCommerz or Stripe's signed webhook confirms it.
- Delivery codes are checked against a keyed hash, with 5 tries per 15 minutes.
- Abuse limits on sign-in, sign-up, orders, codes and the assistant.
- Strict security headers, and a pre-commit scanner that blocks secrets.

WHAT'S NEXT

Online payment keys for SSLCommerz and Stripe, SMS, the key for the Claude assistant, and an own domain. The code for each is already in place and waits only for the owner's accounts.

Designed and built by Miraz Ahmed, with Claude Code as an AI pair programmer.
